

ASSIGNMENT 3- A simple RESTFUL API using React.js, DataBase Creation, and Creating Index

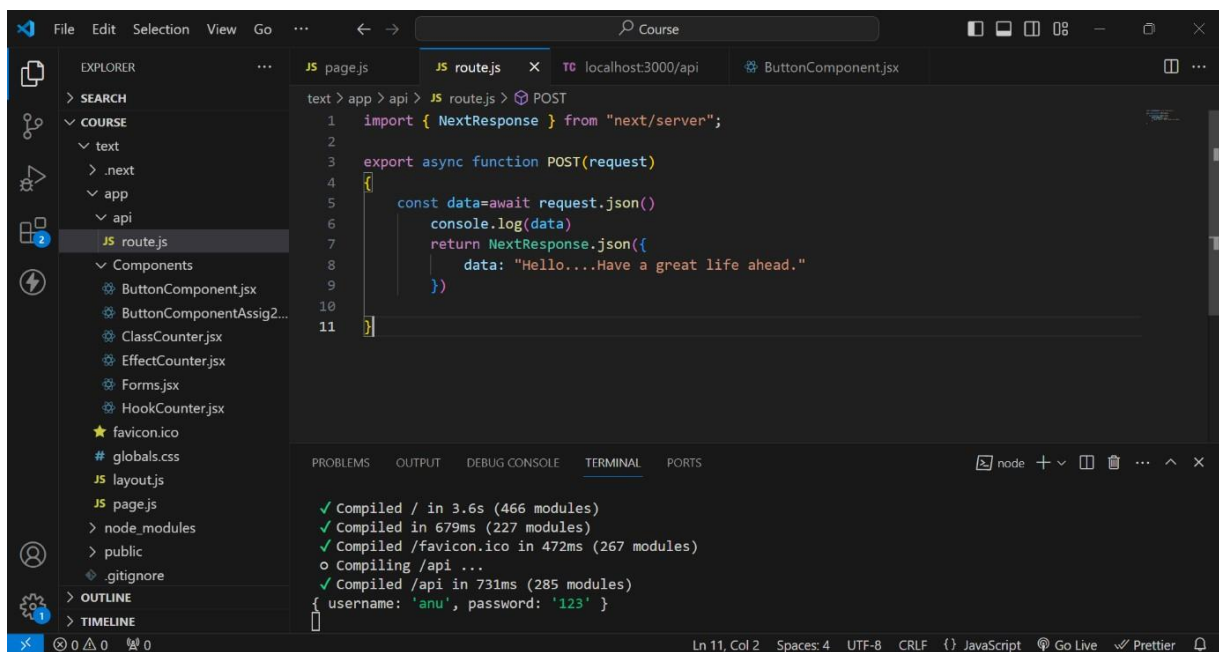

Name:B.Dharanisri

Roll no:20NN1A1203

E-Mail: dharanipraveen37@gmail.com

College: Vignan's Nirula Institute of Science and Techonolgy for Women

RestFul API code

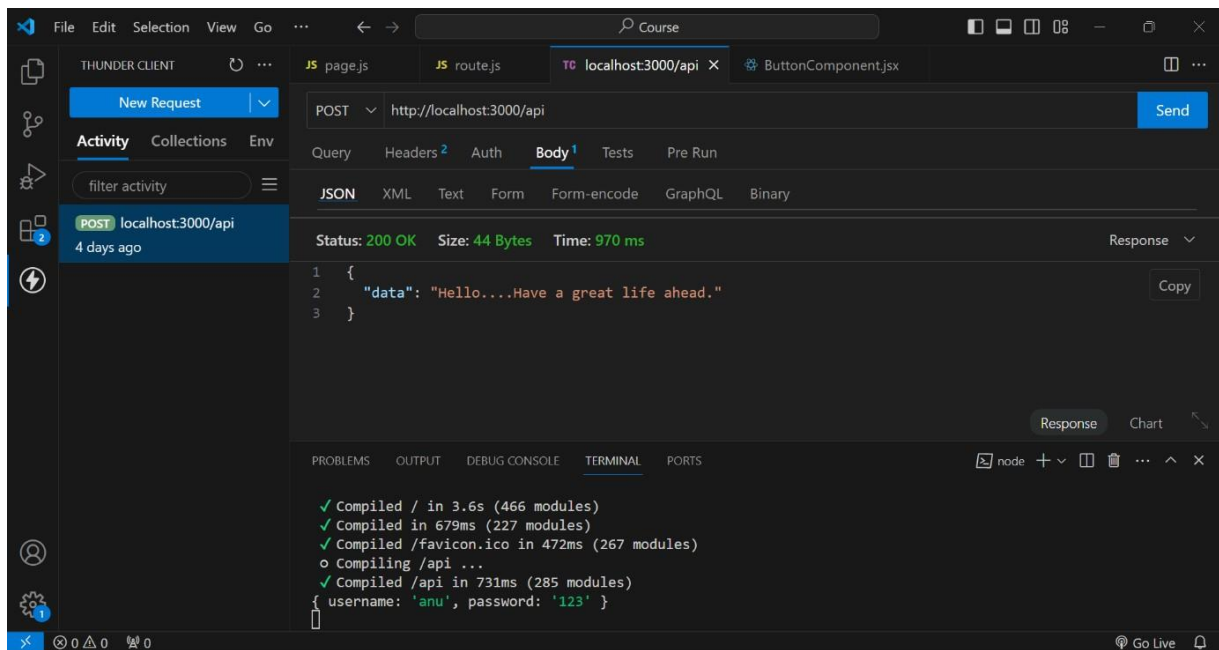

The screenshot shows a Visual Studio Code editor with a project structure on the left. The 'api' folder contains a 'route.js' file. The code in 'route.js' defines a POST endpoint that returns a JSON response. The terminal at the bottom shows the output of the API call, displaying the JSON response.

```
1 import { NextResponse } from "next/server";
2
3 export async function POST(request)
4 {
5   const data=await request.json()
6   console.log(data)
7   return NextResponse.json({
8     data: "Hello....Have a great life ahead."
9   })
10 }
11 }
```

```
✓ Compiled / in 3.6s (466 modules)
✓ Compiled in 679ms (227 modules)
✓ Compiled /favicon.ico in 472ms (267 modules)
o Compiling /api ...
✓ Compiled /api in 731ms (285 modules)
{ username: 'anu', password: '123' }
```

Rest Output on ThunderClient

This is the output when we create an API using REST.

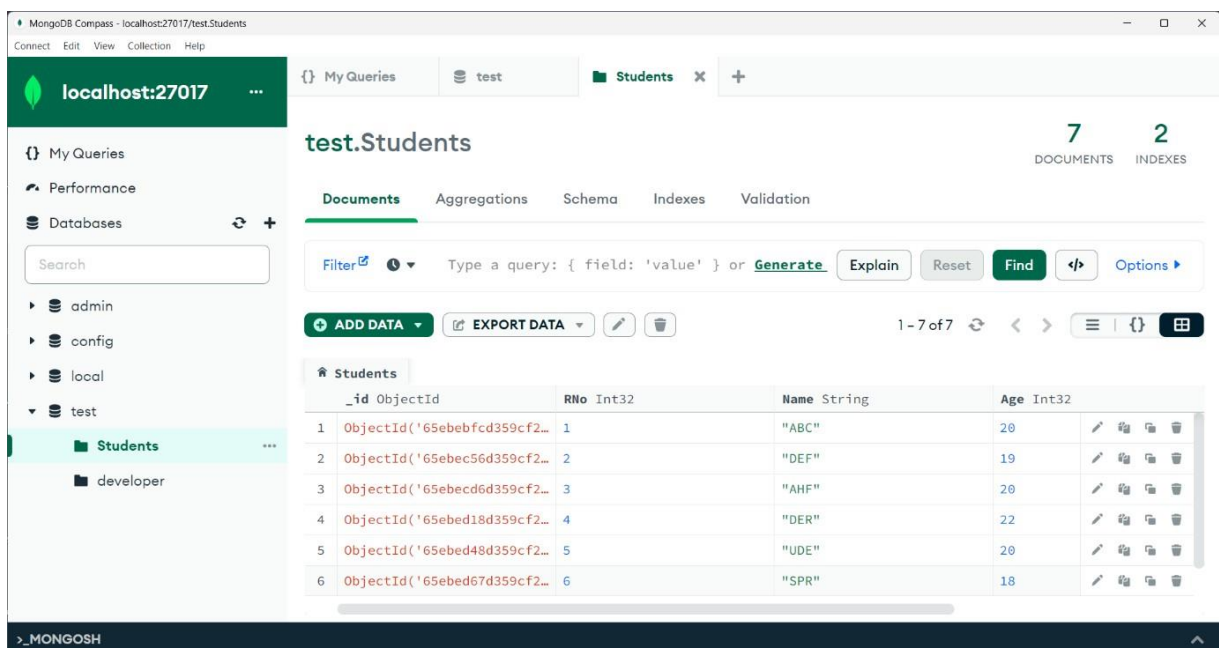

DataBase Creation

1st we created a database named test

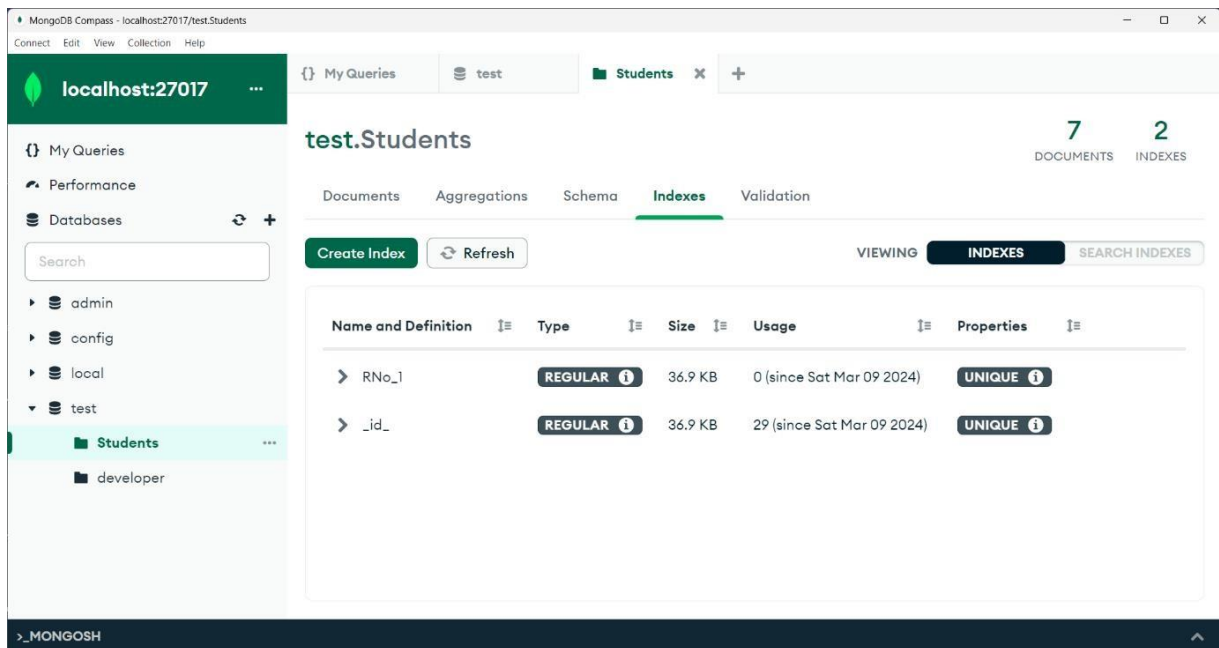

In that test we created a collection named Students

And finally by using ADD DATA , we added data of the students like rno, name, age.

Indexing Creation

As rno is the unique attribute through which we identify a student uniquely. So, here I created an index based on Rno. And assigned unique key to it.

Indexing usage

As we gave Rno as unique, If we try to insert a duplicate document that is existed it shows an error like..duplicate collection.
